

Phase 0: Build Error Fix — Duplicate Exports in documentService.ts

Current Error

```
Transform failed with 10 errors:
Multiple exports with the same name "getDocument"
Multiple exports with the same name "deleteDocument"
Multiple exports with the same name "reprocessDocument"
Multiple exports with the same name "downloadDocument"
Multiple exports with the same name "getProcessingStatus"
```

Location: `D:/VS/tata-ai-legal-document-intelligence-system/frontend/src/services/documentService.ts`

Root Cause

The same functions are being **defined and exported twice** in the same file.

What's Happening

```
typescript

// First definition (line 214)
export async function getDocument(id: string): Promise<DocumentDetails> {
  // implementation
}

// ... other code ...

// Second definition (line 214 again - this causes the error)
export async function getDocument(id: string): Promise<DocumentDetails> {
  // duplicate implementation
}
```

Solution: Remove Duplicates

Step 1: Examine the File

```
bash
```

```
# Navigate to your project
cd D:/VS/tata-ai-legal-document-intelligence-system/frontend

# View the problematic file
cat src/services/documentService.ts | wc -l # Total lines
grep -n "export async function" src/services/documentService.ts # Show all exp
```

Step 2: Identify Duplicates

Look for these patterns:

```
Line 214: export async function getDocument(...)
Line 228: export async function deleteDocument(...)
Line 242: export async function reprocessDocument(...)
Line 256: export async function downloadDocument(...)
Line 291: export async function getProcessingStatus(...)
```

Check: Are any of these defined more than once in the file?

Step 3: Keep Only First Definition

Delete duplicate function definitions, keeping only the **first occurrence** of each:

- `getDocument` — keep line 214, delete any other `getDocument` after it
- `deleteDocument` — keep line 228, delete any duplicates
- `reprocessDocument` — keep line 242, delete any duplicates
- `downloadDocument` — keep line 256, delete any duplicates
- `getProcessingStatus` — keep line 291, delete any duplicates

Rule: If a function is defined twice, remove the second (and any subsequent) definitions.

Step 4: Verify Correctness

After removing duplicates, ensure:

- ☐ Each function is defined exactly once
- ☐ Each function has an `export` keyword
- ☐ Function signatures are complete (all parameters, return types)
- ☐ No syntax errors remain

```
bash

# Check for any remaining duplicates
grep -n "export async function getDocument" src/services/documentService.ts
# Should return only ONE line (or zero if removed)
```

Step 5: Test Build

```
bash

# Install dependencies if needed
npm install

# Run dev server
npm run dev

# Expected output:
# VITE v7.3.6  ready in XXX ms
# → Local:   http://localhost:3000/
# → No errors!
```

Manual Fix (If Above Steps Unclear)

If you can't identify duplicates automatically, **manually inspect** the file:

1. Open `frontend/src/services/documentService.ts` in your editor
2. Search for `"export async function getDocument"` (Ctrl+F)
3. **Count occurrences** — should be 1
4. If count > 1, delete all but the first occurrence
5. Repeat for other flagged functions

Example: Fix for getDocument

```
typescript

// ❌ WRONG (two definitions)
export async function getDocument(id: string): Promise<DocumentDetails> {
  return fetch(`/api/documents/${id}`).then(r => r.json());
}

// ... later in the file ...

export async function getDocument(id: string): Promise<DocumentDetails> {
  return fetch(`/api/documents/${id}`).then(r => r.json());
}

// ✅ CORRECT (one definition)
export async function getDocument(id: string): Promise<DocumentDetails> {
  return fetch(`/api/documents/${id}`).then(r => r.json());
}
```

Alternative: Check for Accidental Copy-Paste

If the file has large duplicate blocks, **search for repeated sections**:

```
bash

# Look for repeated comment blocks or function groups
grep -A 5 "=== Document Retrieval ===" src/services/documentService.ts
```

This often indicates copy-pasted code that wasn't fully cleaned up.

After Fix Verification

Once the build succeeds, verify functionality:

```
bash

# 1. Frontend builds without errors
npm run dev
# Should see: Vite ready at http://localhost:3000

# 2. Test a simple API call in browser console
curl http://localhost:3000/ # Should return HTML (not build error)

# 3. Verify documentService exports are working
# In browser DevTools:
# import { getDocument } from './services/documentService.ts'
# Should not show "multiple exports" error
```

Checklist

- ☐ Identified all duplicate function definitions
 - ☐ Kept only the first definition of each function
 - ☐ Verified no syntax errors remain
 - ☐ `npm run dev` succeeds (no Vite transform errors)
 - ☐ Frontend accessible at `http://localhost:3000`
 - ☐ No "Multiple exports" console errors
 - ☐ Ready to proceed to Phase 1 (Database Setup)
-

If You Still Get Errors

Error: "Multiple exports" still appears

- ☐ Did you save the file after deleting duplicates?
- ☐ Are there other service files importing wrong exports?
 - Check `src/pages/*.tsx` for incorrect imports
 - Check `src/components/*.tsx` for incorrect imports

Error: "The symbol X has already been declared"

- This is a TypeScript/esbuild issue, same solution: remove duplicate export

Error: "Cannot find module"

- You may have accidentally deleted the wrong definition
 - Restore from Git: `git checkout -- src/services/documentService.ts`
 - Then carefully repeat the fix
-

Next: Phase 1 (After Build Works)

Once Phase 0 is complete:

1. Set up database (Supabase PostgreSQL)
2. Create tables (documents, clauses, risk_flags, summaries, etc.)
3. Set up vector DB (Chroma or Qdrant)
4. Create .env with all required secrets

See: `TATA_LEGAL_AI_PHASE_PLAN.md` → Phase 1 for details.

Time to Fix: 5-15 minutes

Difficulty: ★ Easy

Priority: ● CRITICAL (blocks all development)
